I was tired of opening various text files to look through various parts of them. I also didn't want to have to use a separate application to find the location of the text that I wanted to read. After seeing Rowscope I was able to use it to read the contents of a file, find the location of the text that I wanted to view and then scroll to it with a single keystroke. I just wanted to note that because of the size of the files that I need to read, Rowscope tends to slow down the computer, especially older computers. ## What's New in the?

\* Quick, easy, and efficient way to show me just the content I need. \* Very useful when working with very large text files. \* Can be used with all e-mail clients, including Gmail. \* Can be used with Outlook e-mails. \* Does not need a great amount of computer memory. It was very easy to install RowScope as a third-party application and it was very easy to find the icon for it in the Windows 7 start menu. The application just showed up in the list of search results when I typed "text files" into the search box in the search menu and "Rowscope" into the search box in the Search Internet Providers preference pane. In my opinion it's a brilliant feature of Windows 7, since I can have a program that is very useful to me, but that I can also very easily hide if I want.
