AutoCAD Architecture is a 3D architectural animation solution that takes advantage of the computational power of AutoCAD's DWG files and features many of the software functionalities of a 3D modeling package. AutoCAD came with a stand-alone HMI, AutoCAD HMI Server, that can be used for command-line access to AutoCAD and to work as an I/O server for communication with the built-in RMC server. This functionality was used in System Center 2011 R2, and later in System Center 2012 R2 in the AutoCAD/AutoCAD RMC (Remote Monitoring and Control) Connector. In 2018, AutoCAD Engineers launched the Business Edition that is an enhanced version of AutoCAD Architecture. It was first used for the release of AutoCAD 2019. The Architecture Premium 2019 update enabled the construction industry tools; this was released in October 2018. In late 2018, an update for the EMEA editions (Europe, Middle East, and Africa) was released. Releases There have been many updates of AutoCAD since its release in 1989. Releases are issued every five years on the major United States business day, but can take longer if there are major changes. AutoCAD releases may contain backwards compatibility layers that may cause problems. A service release is a

term used in software engineering to describe the delivery of a software build that has a set of changes that allow a user of the software to migrate from an older version to a newer version without losing data. Service releases are delivered for a particular release with the addition of code to customize the service release for the customer. Usage AutoCAD products are used primarily for drafting and design work in the fields of architecture, engineering, landscape architecture, building inspection, and construction management, as well as ancillary fields such as engineering drafting, interior design, and oil and gas pipeline design. In addition to these primary uses, Autodesk's products are used by hobbyists and professionals for entertainment and prototyping. One of the most important uses of AutoCAD in architectural and engineering fields is for the creation of digital architectural drawings. AutoCAD is used for drawing construction project layouts (block diagrams), plans, sections, elevations, and detail drawings, often in conjunction with CAM software such as ISIS and CATIA. For building and civil engineering, engineering analysis is performed on AutoCAD drawings, which has led to concerns ca3bfb1094

A randomized controlled study]. To compare the effectiveness of a group care protocol, versus a conventional care protocol in patients undergoing total hip replacement (THR). A prospective randomized controlled study was conducted between May 2005 and November 2007. All patients undergoing THR at a single hospital were included. Sixty-seven patients were randomly assigned to a group care (n=33) or a conventional care (n=34) group, all patients were evaluated preoperatively, at two and six weeks post-operatively and at three months and one year post-operatively. The main outcome measure was assessed with the Harris Hip Score (HHS), which is a valid and reliable outcome measurement tool. There was a statistically significant improvement in HHS in both groups at the two weeks follow-up visit (P=0.007). However, at the sixth week visit the improvement was still statistically significant in the group care protocol (P=0.001). This improvement persisted throughout the follow-up period. In the group care protocol there was a statistically significant improvement in total HHS (P=0.0025) and pain (P=0.0025). A significant improvement in HHS was seen in the conventional protocol at the sixth week follow-up visit (P=0.0025). However, at three months follow-up, total HHS and HHS of pain and function improved significantly in the group care protocol (P=0.03) whereas this improvement was not significant in the conventional protocol. The results of the present study suggest that the group care protocol had similar clinical benefits to conventional care in
