computer-aided design tool came about because the requirements of the tool were the same as those for a drafting tool, with the exception that drafting is a secondary function. The AutoCAD name was inspired by AutoDesk, the company formed by Alain Tanguy, founder of the Paris office of Sperry, in 1975, and Alain's brother-in-law. In

addition, the word "auto" refers to the fact that the computer in this tool would be programmed with a set of commands, such as moving objects. The first part of the name is an allusion to "auto-dialysis," a technique that was used to help patients with renal (kidney) failure during the 1940s. With this technique, a dialyser (a coil of tubing through

which dialysis fluid is pumped) was connected to a vein or artery that leads from the patient's body to the heart. To keep the vein open and prevent clotting, a solution of blood and chemicals is continuously pumped through the dialyser. AutoCAD evolved from the PC-based drafting tool SoftCAD, which was

introduced in 1978 by Autodesk as a beta version and was designed for use with Apple Macintosh computers. The first public release of SoftCAD came in March 1982 and consisted of the software and a set of customized Apple II-based computers. SoftCAD had been ported from MS-DOS to Apple II. In November 1982, Sperry introduced

AutoCAD for the Apple II, a direct competitor to SoftCAD. With the introduction of AutoCAD, Sperry began to market itself as the worldwide leader in CAD. AutoCAD, which is part of the suite of products called Autodesk Architectural Desktop, was initially marketed with the promise of assisting architects with design of

both residential and industrial projects. However, the application was marketed for other fields as well, such as automotive, electrical, mechanical, civil, and architectural engineering. AutoCAD was a revolutionary product because of its ability to produce CAD drawings from text-based information entered into a

database or from a database

automation. These include: Applying entities

Applying entities is the process of creating, editing, and deleting objects such as lines, arcs, and circles. Applying entities dialog box The Applying entities dialog box shows the entities that are not anchored and which can be modified. It can be used for creating, deleting, and editing the

entities. The selected entities are selected in the drawing. Selecting a closed entity closes the entity and removes the entity from the drawing. The following entities can be selected in the drawing: Lines Arcs Circles Shapes Endpoints Nodes Text Frames The entities are represented by icons in the box. Some of the icons are red. The

icons are accompanied by a small text label showing the name of the entity. When a closed entity is selected, the dialog box shows a closed entity, which can be edited in the drawing. For example, when the closed end of a line is selected, the dialog box shows the line with the end point selected. The entities can be moved in the drawing by

dragging them with the mouse. The cursor changes to show that the entity is being moved. It changes to a curved arrow. If the entity is a circle, the line between the center point and the end point is displayed as a thick red line. The end points of a line can also be dragged to move the line. If the entity is a circle, the circle center

point can be dragged to move the circle. Clicking outside the dialog box will cancel the operation.

Applying entities toolbox

The Applying entities toolbox provides options for selection and editing of entities. It includes two drop-down menus:

Applying entities for selection of entities to edit or delete Entity to apply the selected

entities The drop-down menus show the list of entities that can be selected to edit or delete.

AutoLISP programming interface AutoLISP is a user interface for interfacing with the AutoCAD software. The AutoLISP programming interface is used for creating custom AutoCAD extensions and macros.
