Note Many smartphones are now cameras as well as phones. They're digital cameras and can be as easy to use as a smartphone. ## Shooting Pictures in RAW Format You can shoot your pictures in RAW format. You can then open them in Photoshop and process them as an image editing project. You then have options for what to do with the image and how to save it. Many professional photographers shoot in RAW format because the conversion to JPG format can lose details in the shadows and highlights of the image. RAW format is commonly found in medium- and large-format camera systems but isn't found in today's modern DSLR cameras. However, all recent DSLR cameras can capture images in RAW format. Let's look at how to take a picture in RAW format. 1. ****Turn on your camera****. If you don't have a camera-control panel button, the Back button in the camera menu should turn the camera on. Your camera may not have RAW format options in its menu. If you want to use RAW format with your camera, you need to save the image on a Compact Flash or SD card. There may be a shortcut for capturing pictures in RAW format; that's what was used in the following steps to capture an image in RAW format. You'll learn about that in step 5. 2. ****Set the Mode dial to P, Tv, Av, or M****. This is pretty obvious if you've used your camera before, but it's different in the camera's menus and these directions. Your camera may have a menu option for shooting pictures in RAW format or another setting for shooting video in RAW format. You can use the My Menu setup feature to access your camera menus. 3. ****In the viewfinder (VF), press the shutter button halfway and release it to take the picture****. Note that if you set your camera to JPG mode, you can't use the Shutter button to take a picture. If you take a picture in RAW mode, the Shutter button works just fine
