The field of endovascular intervention for the treatment of vascular diseases has become highly successful since its inception in the 1980s. Over recent years, stent implantation has become the predominant method for vascular intervention. Most advances in the development of stents have been related to improving their deployment, and the ability of the stent to withstand the forces exerted on it during expansion. Early efforts to develop expandable stents involved a relatively small open wire mesh structure, (see e.g. U.S. Pat. No. 4,655,771). It was found that these structures had inadequate radial or hoop strength and tended to close under pressure. Expandable structures as described in U.S. Pat. Nos. 4,503,569; 4,733,665; 4,776,337 and 4,886,062, (all of which are incorporated herein by reference in their entireties) are formed of a series of interlocking rings or filaments connected into a tubular structure by a plurality of nodes. These structures can be deployed with radially outward forces to expand the stent and achieve radial rigidity. Alternatively, they can be withdrawn radially inwards into a collapsed state for endovascular delivery and retention in place. The open wire mesh stents still enjoy widespread use in the

vascular system, but the potential for peri-procedural problems has been found to be more difficult to manage than anticipated. These stents tend to engage, and even penetrate, the vessel wall of the host vessel. This may predispose the host vessel to restenosis. Furthermore, the open wire mesh stents are associated with a number of discontinuities which make it difficult to deliver a drug through the stent to the patient's tissue, and tend to cause some patients to experience a hypersensitivity response to the material from which the stents are formed. Open cell or mesh stents have also been used for delivery of cells to the site of an occluded vessel. For example, U.S. Pat. No. 5,591,127 to Maeda describes a device for introducing cells and cell precursors into a blood vessel. These are expanded by outwardly directed forces. P
