StarScraper is a combination of C#/.NET and open source scraping technologies. It was designed for easy web data extraction and data visualization. License StarScraper is licensed under a permissive, license that allows software around one system to make a copy. It is most commonly used by commercial software vendors but also organizations of any size that want to extract data from the web. The original permissive license was commercial, but one of the main drivers behind the StarScraper project was to create tool that could be freely distributed. StarScraper is considered to be dual-licensed. It's available under both the permissive MIT license and a commercial license with restrictions. Open Source Code The StarScraper project downloads for StarScraper are created, saved, and packaged by its contributors. All the original StarScraper downloads are in the git repository. StarScraper contributors are encouraged to submit any additions, updates, bug fixes, or new features they want to the main StarScraper git repository. In the main git repository there are several sub-repositories, where issues are handled by the StarScraper sub-committee. In order to see the latest code from the source repository you can see what's new on GitHub. Visual C# Users Low-Level Data Access : Based on Lib for System.Data.SqlClient. High-Level Data Access : Built on top of "Visual WebParts" (VWP) StarScraper is built on top of the class libraries. For a more complete description on how to use these libraries, including how to add StarScraper support in your own software, view the Getting Started guide. Getting Started Getting Started Open Source A Scraper written in static source code is opened for all to see. This allows anyone to view it's internal workings and contribute to it. Anyone can take a copy

of the code and distribute a binary version of the Scraper to their users. Traditionally, open source licenses have provided license restrictions to restrict the usage of the licensed code. This is one of the main reasons to use the open source license style. As Open Source is built on the communal code-sharing concept, taking code outside the open source community is both against the common practice and against the open source license. In order to counter this, StarScraper is heavily distributed as open source and dual-licensed.

abstract: | The semistability of extremal Kähler metrics on flag varieties has been completely understood within the theory of polarized projective manifolds. This has been accomplished by the application of the uniformization theorem and the study of the stability properties of holomorphic vector bundles. In this note we provide a different approach for the rational case by introducing a generalization of the concept of stability due to King which we apply to flag manifolds. We describe the geometry of stable bundles on flag manifolds and use this description to prove that the intersection of any polytope and a rational ray in the Kähler cone is also a rational ray. This allows us to provide new proofs of several stability results concerning flag manifolds. author: - Josef Sosa bibliography: - 'bibliography.bib' title:
