When should I use the sp\_configure (specifically what indexes are relevant to me) and when the sp\_configure2? What are the differences in them? A: This is just a starting point. I have not done much searching on this, but you might want to start here and here. There is also a blog post at ServerFault here. Note that the 2003 article is from 2008. A: SP\_Configure is the way to alter the current server configuration. Instead of running sp\_configure 2 times, there is sp\_configure. If you have two similar variables like "max\_messages\_delivery" or "max\_log\_size", you can just add them.
