The legend on the Camera Raw screen gives you some insight into what each function does, and although it may take time to figure out some of the more obscure terms, Photoshop's many layers and multiple undo/redo levels can be very powerful. Creating a document Even if your main goal is to edit an image, you must start by opening a new file. Even if you're going to change only a small section of an image, you may benefit from starting over so that you can delete extra layers and start your edits where you last left off. If you're new to Photoshop,

opening a new file is simple. In most versions of Photoshop, you click the New button on the File menu, choose the source from the drop-down menu, and then click OK. This opens a new Photoshop document. If the current document is too busy, click the Close button on the top-right corner of the window to close it. If you open a new file before saving your work, a Save As box opens and asks you to choose a file name and location. You can use this box to change the name and location of the document. PhotoShop Elements provides only the New Document option in the File menu. If you are working in the Organizer, you can select File⇒Create New. The New Document has two subheads — Step 1 and Step 2 — that you see when you open a new document. Step 1: Set up the Document If you're starting with a

completely blank canvas, you can save time by simply using Step 1. The first step is to set the size and type of document. 1. Choose Format⇒Size. The Size subhead appears, as shown in Figure 4-5. This subhead offers three options for the overall size of the image in pixels: Width and Height in inches or centimeters; or Width and Height in pixels. (Pixels are measured in the number of dots on a line of type.) If your monitor's resolution is different from the default, you can customize these two subheadings. 2. To choose an option in the Size subhead, click the down arrow. **Figure 4-5:** You can find the Size button in the Format panel. 3. Click the type of file to create in the drop-down menu. File types include JPEG, TIFF, PNG, GIF, or PSD (Phot

initiator_data_request_packet_handler() sends a data request packet to the slave directly without any commands. Now we have an idea about how to construct a data request packet we can now define a function to send request directly to the device we want data from. We can use libusb to open the device and then send a request and read the response. To get more information about which endianess the device uses we need to use libusb's device capabilities. By using libusb_get_device_descriptor() we can get the device descriptor. We want to know the vendor and product IDs. The vendor ID will be 0x1d40 and the product id will be 0x5257. Therefore we should use vendor ID 1d4 and

product ID 5257 in the libusb_open() call. In libusb_open() we need to indicate whether we want read or write access. int libusb_open(struct libusb_context *ctx, struct libusb_device_handle *handle, unsigned char endpoint_number); For read operations we want "endpoint_number" to be 0x81 and for write operations we want "endpoint_number" to be 0x82. Therefore we write 0x81 and 0x82 to the "endpoint_number" parameter before using libusb_open(). Let's call this function send_data_request_packet(). size_t send_data_request_packet(struct usb_device_printer *usbdp, uint8_t endpoint_number, uint8_t *data, size_t length); send_data_request_packet() sends a data request packet to the device we want data from. It is similar to the command packtes sent from the computer but we can

use the endpoint number to get our data. We need to pass two parameters to the function, a "usb device printer" and an endpoint number. Because we will be sending data out of the printer this endpoint number will be 0x81. We also need to pass a pointer to the data we want to send to the device. This pointer is a void pointer because the data will be sent using data. We call the function length to tell it how much data we want to send. In the end we want to
