Adobe isn't a big fan of a "staggered" release schedule, especially since. In this case, the 5.3 update added so many new features and capabilities that by not releasing them as one big upgrade, they're now stalling other features and, seemingly, changing the roadmap at the same time as well. The only good part I have to say about this is that as the old lady twinkles up at me as I sit at the campfire all bundled up in my hand-warmed sleeping bag, I can half hear her full heartedly expressing her wish to "please, just let somebody else take care of it next time" – and thus saving me from having to sit through the "A Day in the Life of…" briefing again. If you use Lightroom on a desktop computer, but want to organize your photos on a mobile device, Lightroom syncs your photos, but only provides a limited amount of editing capabilities on the web. Finally, one more gripe. Adobe has been slapping the "LS" after their products in their file names and product names. However, as my son can probably attest to, this leads to the letters getting awfully small as the things get smaller. In the case of Photoshop Sketch, when the cursor is in the "Mode/keyboard" view, there are always small gray letters on the toolbar. This is to let the user know that the cursor is in an editable view, but they're really small and hard to decipher. The gripe I have is that the view's background is gray. If you use Photoshop, you know that it doesn't change color because of this designation.. so why in Sketch? If you're not going to change the color of the default background, then make it white.

When it comes to RAM, again, if you are able to buy more than do so. RAM is what allows your computer to handle multiple tasks at once. When working as a designer or digital artist, using multiple Adobe applications at the same time can become a very normal practice. Adobe applications can be very taxing on any computer and more RAM helps to complete those tasks quickly. Having more RAM connected to your processor will ensure you have a highly optimized powerhouse computer to handle any and all Photoshop tasks. Ever since I was able to afford my own computer, I never purchased a computer with less than 16GB of RAM. Most computers nowadays come with at least 8GB of RAM which is sufficient. The one nice thing about RAM unlike a processor is that you can replace the RAM and add more after purchasing it. However, make sure to check this as again, companies like Apple have made it impossible to replace the RAM in their computers. It is always worth double checking! **What software do most graphic designers use?**
